Chapter 1

Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Layer	3
Network	3
Node	
Class Node	3

Chapter 2

Class Documentation

2.1 Layer Class Reference

The documentation for this class was generated from the following file:

- /home/marc/Documents/1. Développement/4. C++/1. Neural Network/ANN_cpp/src/layer.hpp

2.2 Network Class Reference

The documentation for this class was generated from the following file:

- /home/marc/Documents/1. Développement/4. C++/1. Neural Network/ANN_cpp/src/network.hpp

2.3 Node Class Reference

Class [Node](#).

```
#include <node.hpp>
```

Public Member Functions

- [Node](#) (int nbIn)
Construct a new [Node](#) object.
- double [processOutputs](#) (std::vector< int > inputs)
Method to process the outputs of the node.
- double [getWeight](#) (int index)
Get one of the weight.
- double [getBias](#) ()
Get the Bias.
- int [getNbInput](#) ()
Get the number of input.

2.3.1 Detailed Description

Class [Node](#).

Class which represent the behaviour of a [Node](#) in an Artificial Neural [Network](#).

2.3.2 Constructor & Destructor Documentation

2.3.2.1 Node()

```
Node::Node (
    int nbIn )
```

Construct a new [Node](#) object.

Construct a new [Node](#) object by creating random weights and a random bias.

Parameters

<i>nbIn</i>	corresponds to the number of inputs of the created Node .
-------------	---

2.3.3 Member Function Documentation

2.3.3.1 getBias()

```
double Node::getBias ( )
```

Get the Bias.

Returns

double : the bias.

2.3.3.2 getNbInput()

```
int Node::getNbInput ( )
```

Get the number of input.

Returns

int : the number of input.

2.3.3.3 `getWeight()`

```
double Node::getWeight (
    int index )
```

Get one of the weight.

Parameters

<i>index</i>	of the weight we want.
--------------	------------------------

Returns

double : the weight.

2.3.3.4 `processOutputs()`

```
double Node::processOutputs (
    std::vector< int > inputs )
```

Method to process the outputs of the node.

Method which realise the calculation of the output by doing the dot product of the weights by the inputs. Then it add the bias and finally it use the Activation Function on the resulting scalar.

Parameters

<i>inputs</i>	: the inputs of the node.
---------------	---------------------------

Returns

double : the state of the node after the calculation.

The documentation for this class was generated from the following files:

- /home/marc/Documents/1. Développement/4. C++/1. Neural Network/ANN_cpp/src/node.hpp
- /home/marc/Documents/1. Développement/4. C++/1. Neural Network/ANN_cpp/src/node.cpp
